

Milestone 2: Subject-Level Clinical Review

Sanofi EFC10261 SDTM Submission

Study Overview

- Study: Phase II Non-Small Cell Lung Cancer (NSCLC)
- Subject: 010261-000-999-450
- Treatment Arm: Placebo + Docetaxel

Objective

Demonstrate subject-level clinical review using SDTM domains by integrating treatment exposure, adverse events, disease assessments, and patient-reported outcomes to reconstruct an individual patient's clinical course.

Key Findings

- Grade 2 urticaria occurred early in treatment and was associated with a dose reduction.
- Grade 3 peripheral sensory neuropathy later resulted in treatment interruption.
- Patient-reported outcomes improved early, worsened during mid-study, and improved again during follow-up.
- Target lesions demonstrated a mixed response, with substantial shrinkage in one lesion while others remained stable or increased in size.
- Disease progression was recorded on Study Day 450.

Clinical Figures

Figure 1. Patient-Reported Outcomes

LCSS Total Score and ASBI improved early, worsened mid-study, and improved again during follow-up.

Figure 2. Target Lesion Size Changes from Baseline

Individual target lesions demonstrated heterogeneous behavior, highlighting a mixed response.

Figure 3. Subject-Level Clinical Timeline

Treatment exposure, clinically important adverse events, and disease progression summarized across the study timeline.

Programming Summary

Scripts Developed

- 01_select_subject.R
- 02_subject_timeline.R
- 03_clinical_review.R
- 04_create_figures.R

Skills Demonstrated

- SDTM domain integration
- Subject-level clinical data review
- Longitudinal data visualization with ggplot2
- Clinical interpretation supported by SDTM evidence
- Reproducible R programming workflow
- Version control using Git and GitHub
